(57) **ABSTRACT**

An approach is provided for determining one or more group decision points based, at least in part, on user preference information during a group communication session. A coordination platform determines a request for presenting one or more group decision points in a conversation user interface of a group communication session. The coordination platform causes, at least in part, a presentation of at least one decision point user interface element in the conversation user interface, wherein the at least one decision point user interface element presents one or more parameters associated with the one or more group decision points for one or more interactions by one or more members of the group communication session. The coordination platform further processes and/or facilitates a processing of the one or more interactions to cause, at least in part, a fixing of at least one outcome of the one or more group decision points for the one or more members.
